Aibek Shynazbek

Backend Engineer — Java / Kotlin · Fintech & Payments

Milan, Italy · Almaty, Kazakhstan · open to remote | +7 707 616 19 41 | aakkuliyev@gmail.com | linkedin.com/in/aibek-shynazbek-69458723a | github.com/aibekdevx

SUMMARY

Backend engineer with 3 years of production experience in Java, Kotlin and Spring, building lending and payment systems. I make money flows correct and fast: idempotent payment processing, PostgreSQL performance tuning and safe changes to live systems.

EXPERIENCE

Software Engineer (Java/Kotlin) — DataArt Sep 2025 – Present

Consumer-lending platform (fintech), Kazakhstan · Java 21, Kotlin, Spring Boot, Camunda, Kafka, PostgreSQL

- Made bank-repayment posting to the core banking system idempotent (~230 payments/day, ≈₸2B/month; 7 bank integrations) via a pre-call status state machine, idempotency keys with lookup-before-retry and advisory locks — undelivered payments cut from 84/month to 0, zero double postings.
- Raised automatic payment-to-contract matching to ~96% with a matching cascade (contract number → restructuring chain → transliteration → national ID → guarantor), shared by all bank connectors (–1,000 duplicated lines).
- Halved the nightly debt-collection batch (40 → 20 min; 4.6M rows, ~164K contracts) by replacing a JPA read-map-write step with a server-side *INSERT…SELECT* (step 23 min → 40 s, 35×), verified against legacy output before rollout.
- Cut a critical operator-screen query from 22 min to 7 ms by rewriting a correlated subquery and adding an index built with *CREATE INDEX CONCURRENTLY* (zero downtime); made *lock_timeout*-guarded migrations a team practice.
- Fixed Spring Batch jobs stalling after deploys (startup recovery, heartbeats, isolated manual-run pool, missed-run alert); manual reruns went from 90+ min to ~3 min.
- Built features in a Camunda + Kafka loan-origination pipeline (~60K applications/month, 15 dealer groups): a new partner channel, collateral products and regulator-mandated credit-bureau reporting (REST/SOAP) via a persistent retry queue with 100% delivery.

Lead Backend Engineer (contract) — Apatai Jul 2025 – Present

Two-sided nanny marketplace, Kazakhstan · Java 17, Spring Boot 3.5, PostgreSQL 16, Docker, GitLab CI

- Own the backend end-to-end (~86% of the code): 116 REST endpoints for two Flutter apps and a Vue admin, ~200 Testcontainers tests, GitLab CI to Docker/nginx, Grafana Loki logging.
- Built Kaspi payments (invoice + webhook) with idempotency, HMAC verification and row locking; eliminated balance drift and duplicate payouts with pessimistic locks and partial unique indexes.
- Ran the pre-launch security audit and shipped ~25 P0/P1 fixes in a day (IDOR, exposed database, master OTP, token rotation).

Java Developer — MagnumGO Nov 2023 – Sep 2025

Grocery delivery app of Magnum, Kazakhstan's largest grocery retail chain · Java 17, Spring Boot, PostgreSQL, Redis

- Developed and maintained order, subscription and payment services; designed REST APIs and service integrations.
- Reduced database load on read-heavy endpoints with PostgreSQL query tuning and Redis caching; wrote JUnit/Mockito/Testcontainers tests and reviewed the team's code.

SKILLS

Languages: Java (8–21), Kotlin, SQL

Backend: Spring Boot, Spring Data JPA / Hibernate, Spring Batch, Spring Security, Camunda BPM, REST/SOAP

Data & messaging: PostgreSQL (query tuning, indexing, locking, Flyway), Redis, Kafka

Infrastructure & quality: Docker, GitLab CI/CD, AWS (EC2, S3, RDS), nginx, Grafana / Loki, Zabbix, JUnit 5, Mockito, Testcontainers, Gatling

EDUCATION & CERTIFICATIONS

BSc in Software Engineering — International IT University 2021 – 2025

AWS Certified Developer – Associate — Amazon Web Services 2026

LANGUAGES

English — C1 · Russian — C2 · Kazakh — native · Italian — A1 (learning)
