SUMMARY

Backend engineer with 3+ years of experience building production fintech systems in Java and Kotlin — loan origination, debt collection and bank payment integrations. Designs distributed, event-driven services on Spring Boot, Kafka and PostgreSQL, with a focus on idempotency, failure isolation and production observability. Certified React developer (DataArt) — able to take ownership of full-stack projects when a team needs it.

WORK EXPERIENCE

Java Software Engineer | DataArt

Sep 2025 – Present

Java 21, Kotlin, Spring Boot 3, Kafka, PostgreSQL, Camunda BPM, Docker, GitLab CI/CD

- Designed the integration layer of a payment-ingestion service covering **7 banks** using Strategy and factory patterns, isolating each bank's authentication, pagination and statement format in its own connector so the core pipeline stays untouched when a bank is added.
- Made ingestion idempotent under at-least-once delivery and automated contract resolution for incoming payments, replacing manual reconciliation of bank statements with an automated pipeline.
- Built asynchronous application intake on **Kafka (6 topics, 20 partitions)** connecting 10 external dealer marketplaces to a loan pipeline with multi-minute underwriting decisions; per-topic DLQ and manual acknowledgement isolate a failing partner instead of stalling the partition.
- **Optimised the daily batch jobs of the collection service, cutting runtime from 35–45 to 15–20 minutes (~60%)** and moving completion out of the morning working window.
- Containerised services with Docker and automated the GitLab CI/CD pipeline, replacing manual script-based deployment with a reproducible build-and-release process.
- Implemented integrations with **government services and credit bureaus** (REST/SOAP) for decision and disbursement reporting, and migrated an existing bureau integration to a new API version with a persisted retry queue for delivery guarantees.
- Built web frontend for internal tooling in **React / TypeScript** alongside backend work.
- Owned production reliability: root-caused incidents across logs, database and outbound HTTP traces, redesigned service health checks to remove false outage alerts, and introduced safe DDL rollout under load.

Java Developer | MagnumGO

Nov 2023 – Sep 2025

Java 17, Spring Boot, PostgreSQL, Redis, Docker

- Built and owned order, subscription and payment services for a high-traffic e-grocery platform.
- Designed REST APIs and service-to-service integrations across the platform's backend.
- Optimised PostgreSQL access paths and introduced Redis caching for hot reference data, reducing database load on read-heavy endpoints.
- Covered core flows with JUnit, Mockito and Testcontainers; regular participant in code review.

TECH STACK

Languages: Java 8/17/21, Kotlin, SQL, Bash

Frameworks: Spring Boot, Spring MVC, Spring Security, Spring Data JPA, Hibernate, Camunda BPM

Databases: PostgreSQL, MongoDB, Redis, Flyway / Liquibase

Messaging & Caching: Apache Kafka, RabbitMQ, Redis, Caffeine

Reliability: Resilience4j, DLQ & retry design, idempotency, scheduled jobs

Frontend: React, TypeScript, JavaScript

Testing: JUnit, Mockito, Testcontainers, Gatling

Tools & DevOps: Docker, Git, GitLab CI/CD, Gradle, Maven, OpenAPI / Swagger

Cloud & Monitoring: AWS (EC2, S3, RDS), Grafana, Zabbix

EDUCATION AND CERT.

BSc in Software Engineering
International IT University
2021–2025

AWS Developer – Associate
Amazon Web Services (AWS)
2026 – 2029

React Developer Qualification
DataArt internal certification
2026
